HOMEWORK 4

Answer all questions from practical assignment 4.

Section(s):

Create a new LXD container and install Icinga on it

Question: Can you explain what this command does?
Answer: Directly from the `lxc` man files: `file    Manage files in containers`. So this command allows us to easily access files inside any container, thus minimizing work for us!

Question: Can you explain what these commands does?
Answer: These commands add a gpg key to the system, which will allows us to then access the packages repository and install it.

Install and configure Icinga Web

Question: Make sure to use the correct IP address! Also note, that by default Icinga Web uses HTTP, which is a very bad idea for production setups. Can you explain why?
Answer: Because that missing `S` from the end of `HTTP(S)` is quite important for security.

Configure basic monitoring of the new containers

Question: Can you explain the purpose of vars.foobar ?
Answer: This is just a naming convention more than anything. We are declaring that we have a variable with that name and we are assigning to it the servers name.
